**Added value for
non-residential projects.**

MeerDeur. Added value for non-residential projects.

Doors in industrial environments have to meet different requirements in varying situations. Functionality is an absolute must, and operational reliability is generally the primary requirement. Also, the architectural aspect can play a role. And it must also be possible to automate a door if required. MeerDeur is a specialist in doors and door operators for non-residential construction projects. MeerDeur doors have already been installed in numerous business premises.

With MeerDeur you can count on well-informed advice, especially since the entire process from design through to installation is under one roof. This means that we can be more flexible in dealing with the very varied range of requirements that doors in business premises have to meet. Your door will be made to measure in our own production unit that has all the most modern technical facilities. It will be supplied in the matching colour for your premises. And the aluminium profiles that MeerDeur uses are both light and robust. There is no better guarantee that your door will last for years.

Automatic models as well

Do you have a door that is opened frequently? If so, then it's more efficient to choose an automatic model. MeerDeur can fit a Gatemaster® automatic drive to your door. This system is already providing optimum service in numerous other business premises. The Gatemaster® Excel is available in a number of different models. Waiting for a door to open will be a thing of the past for your employees: the new door will open at the exact speed and to the precise width you set. As an added benefit, this also minimises energy loss between different areas.

Safety first

It goes without saying that the Gatemaster® is also designed for maximum safety. The system can detect any obstacles that make closing impossible. The door will then return safely to its open position, and the following closing cycle will be at a slower speed. Do you need even more assurance? The Gatemaster® automatic drives can be fitted with additional safety features.

You will still have normal access to your premises in the event of a power failure by switching to the optional battery pack or manual door operation if required. To guarantee years of problem-free use, there is the option of arranging a service contract.

Speeddoor® speed roller doors

Are you looking for maximum functionality? The Speeddoor® speed roller door is the ideal means of closure for use between two areas that have to remain physically separated as much as possible. It consists of a door plate fitted with horizontal bands of plastic sheet strengthened with polyester. The electrical drive guarantees fast opening and closing. The sides are standardly made from aluminium profiles, and the bottom profile is fitted with a rubber impact section. In addition, the Speeddoor® provides optimum insulation, as proven by its use in cold stores.

The system is maintenance-friendly, and minor impacts leave no mark. What if the electricity blacks out? The manual operation option ensures accessibility under all conditions. To guarantee years of problem-free use, there is the option of arranging a service contract.

A partner that understands your business

MeerDeur is a partner that fulfils its agreements and also has a healthy element of built-in flexibility to accommodate planning changes efficiently. You always have access to a specialist who understands business: your business. Would you like to receive more information without any obligation? At MeerDeur the door is always open.
